

CHEMICAL PEELS:

There are several strengths and formulations of chemical peels available to you and they are often used in conjunction with other aesthetic treatments. Chemical peels have the ability to significantly restore the quality and texture of the patient's skin. Chemical peels use a chemical solution, usually an acid, to 'peel' away the top layers of the epidermis in order to improve conditions such as acne, irregular pigmentation or wrinkles. Peels help to stimulate epidermal production to revitalise the skin. It allows for better absorption of skincare products by increasing the permeability of the skin.

Chemical Peels are performed on the face, neck, hands, décolletage areas as well as birth marks on the body. They can be used to:

- Reduce fine lines under the eyes around the mouth
- Treat premature aging caused by sun damage and family history
- Improve the appearance of scarring
- Treat acne and blackheads
- Reduce age spots, freckles and dark patches caused by hormonal changes
- Improve the texture, colour and appearance of the skin
- Melasma
- Keratosis
- Reduce stretch marks
 - ✓ Best Results – 6-8 sessions
 - ✓ Treatment recovery – 1-4 days
 - ✓ Risks & Complications – low
 - ✓ Procedure time – 30-60min
 - ✓ Back to work – Same day
