

DERMAL FILLERS

Volume loss is a fundamental component of facial aging. Contributing factors include fat redistribution, skeletal remodelling and other changes in tissue composition. Hyaluronic acid fillers and bio stimulators are an established means of addressing volume loss, correcting contour defects and providing support and structure to the face.

The fillers are injected beneath the surface of the skin to regain tissue volume and create a smoother and more youthful surface. The fillers are very effective at gently easing out lines and creases that can appear as a result of ageing.

How long do Dermal Fillers last?

Typically, up to 12 months as the product is gradually and naturally absorbed into the skin.

How long will the Dermal Fillers treatment take and does it hurt?

The Dermal Fillers treatment is absolutely painless and takes around 20 minutes – allowing you to immediately go back to what you were doing before

Before and after:
